www.exo-tec.biz

Industry Issue 1

Why do I want to make my building air tight?

How is it supposed to dry out?

Industry Issue 2

How is the wall supposed to “ breathe “ if it has an air barrier in it?

Industry Issue 3

**Don't you need to have air leaking into the building
to keep the air inside it fresh?**

The Wetting Potentials

Liquid Water Ingress

Moisture Transport Due To Air Flow

Dew Point

Vapor Migration

**How Do We Properly Deal
With These Four Wetting
Potentials???**

Good HAMM!!!

What the #@\$\$& is HAMM ?

- HAMM is the 4 barriers needed to protect a building against the effects of weather. These barriers are:

H **Heat Barrier**

A **Air Barrier**

M_L **Water Barrier (Liquid Moisture)**

M_v **Vapor Barrier (Gaseous Moisture)**

HAMM is the WEATHER BARRIER SYSTEM

HAMM Order Of Magnitude

M_L Water Barrier (Liquid Moisture)

A Air Barrier

H Heat Barrier

M_v Vapor Barrier (Gaseous Moisture)

Good HAMM effectively deals with thermal transfer, wetting and drying potentials:

Heat Barrier

- Thermal loss, gain and bridging
- Wetting potential due to a dew point (location)

Air Barrier

- Thermal loss and gain
- Wetting potential due to moisture transport via air flow

Good HAMM effectively deals with thermal, wetting and drying potentials:

Water Barrier

- Wetting potential due liquid moisture intrusion into and through the Building Enclosure System.**

Vapor Barrier

- Wetting potential due to vapor diffusion into and through the Building Enclosure System.**

THE WATER BARRIER

- **Resists the intrusion of moisture in its liquid form (water) into and through the building enclosure system.**
- **Over the history of Building Enclosure System use, water barriers have been:**
 - **Ineffective due to their inability to resist water penetration.**
 - **Ineffective due to improper installation.**
 - **Ineffective due to lack of longevity.**
- **If an air barrier is properly designed and installed in a building enclosure system and the air barrier material is also a water barrier, won't the past deficiencies of water barrier be resolved?**

Why is my building leaking?

Why is my building leaking?

Why stop the flow of air into and through the BES?

First and foremost.....

1.) Air flow has the ability to transport exponentially more moisture into and through the building enclosure system than occurs through vapor migration or diffusion. Estimates range from 30 to 200 times more moisture transport occurs via air flow than vapor migration.

Excess moisture in exterior walls causes:

Corrosion of metal items

Excess moisture in exterior walls causes:

Photo of mold in wall. Photo supplied courtesy of Canadian Home Builders' Association (CHBA) and Canadian Mortgage and Housing Corp. (CMHC)

The “ M “ Word

Excess moisture in exterior walls causes:

Efflorescence

2.) Air flow into and out of buildings can affect the location of the dew point.

3.) Air leakage into and out of buildings causes the HVAC system to expend extraneous energy in order to maintain the building's desired temperature and humidity levels.

4.) Air flow is a vehicle by which sound travels.

5.) Air flow is a vehicle by which particulate matter travels.

6.) Air flow is a vehicle by which odors and gaseous substances travel.

THE VAPOR BARRIER

Vapor barriers are materials used in Building Enclosure Systems to retard the diffusion of vapor into and through the building enclosure system.

Why Are Vapor Barriers Needed?

By retarding the diffusion of vapor through the Building Enclosure System, conditions that create dew points within Building Enclosure Systems can be reduced or prevented and interior RH levels can be maintained.

What Is Vapor Diffusion?

Vapor diffusion is the process by which vapor seeks to equalize its content between different environments (the Ideal Gas Law).

The driving force (or “potential”) for this occurrence is vapor pressure.

Vapor pressure is a function of the vapor content of the air (RH) and the temperature.

Vapor diffusion is caused by a vapor pressure differential (ΔP) between different environments. The greater the ΔP between environments, the greater the amount of vapor diffusion that occurs.

**Table 1. VAPOR PRESSURE FOR VARIOUS TEMPERATURES AND RELATIVE HUMIDITIES
(POUNDS PER SQUARE INCH).**

Dry bulb temperature	Relative humidity (in percent)									
	100	90	80	70	60	50	40	30	20	10

The Dew Point

The dew point is the temperature at which air that contains a certain amount of vapor can no longer hold that vapor and must exhaust itself of excess vapor by depositing it on adjacent surfaces in the form of condensation (water).

Where does the water on the outside of the glass come from?

Dew Point Calculator

The dew point is the temperature at which condensation forms on condensing surfaces. When air comes into contact with a surface that is at or below the dew point temperature of that air, condensation will form on it.

EXAMPLE 1: If the interior air temperature is 70° F and has an RH of 30%, the infiltration of air that is 37° F (the dew point temperature) can cool condensing surfaces to this temperature (37°) causing dew to form on these surfaces.

EXAMPLE 2: If exterior air with a temperature of 85° F and an RH of 70% infiltrates into the building envelope, dew will form on condensing surfaces in the system that have temperatures of 74° F or less.

THE DYSFUNCTIONAL BUILDING ENCLOSURE SYSTEM

VENEER (PROTECTIVE LAYER)

CAVITY (DRAINAGE SPACE)

WATER RESISTANT BARRIER
(DRAINAGE PLANE)

FIBERGLASS BATTS INSULATION
(HEAT BARRIER)

LGMF & GWB (STRUCTURAL LAYER)

VAPOR BARRIER ???

BRICK VENEER IS A “ RESEVOIR “
CLADDING MATERIAL. IT WILL HOLD
MOISTURE AND WHEN HEATED BY SOLAR
RADIATION, WILL CREME EXTREME
TEMPERATURES AND VAPOR PRESSURE
LEVELS IN THE CAVITY SPACE

GWB SHEATHING IS NOT PROTECTED FROM
MOISTURE INTRUSION IN ITS GASEOUS
FORM

GWB ABSORBS AND RETAINS MOISTURE
AND WILL DEGRADE OR DETERIORATE
UNDER FAIRLY LOW MOISTURE CONTNENT
LEVELS AS WELL AS HOST MICROBIAL
GROWTH

LGMF SYSTEMS WITH GWB AND VAPOR
BARRIERS CREATE CHAMBERS FROM
WHICH VAPOR CANNOT BE EASILY VENTED

LGMF MEMBERS WILL CORRODE WHEN
EXPOSED HIGH RH LEVELS

GYPSUM SHEATHING, RIGID
POLYSTYRENE INSULATION OR
POLYOLEFIN FILMS W/ TERMINATIONS
AND PENETRATIONS SEALED

CAVITY INSULATION (IF REQUIRED)

LIGHT GAGE METAL FRAMING BACK UP
WITH FIBERGLASS BATTS INSULATION
BETWEEN STUDS

POLYETHYLENE VAPOR BARRIER

INTERIOR GYPSUM WALL BOARD

NOTES

- 1.) ALL SCREW PENETRATIONS THROUGH EXTERIOR GWB MUST BE SEALED
- 2.) ALL VENEER ANCHORS MUST BE BEDDED IN SHEET OR LIQUID APPLIED AIR BARRIER TO PREVENT AIR LEAKAGE
- 3.) TERMINATION OF EXTERIOR GWB AT THE UNDERSIDE OF RELIEVING ANGLES AND DECKS MUST BE SEALED WITH SHEET APPLIED AIR BARRIER.
- 4.) TOP EDGES OF SHEET APPLIED AIR BARRIER MUST BE SEALED WITH LIQUID MEMBRANE OR MASTIC.

Cold Climate Vapor Permeable Air Barrier System: Winter

EXTERIOR AIR

30° F

- RIGID INSULATION
- SHEET OR LIQUID APPLIED AIR BARRIER MEMBRANE
(AIR AND VAPOR BARRIER)
- GYPSUM WALL BOARD
- LIGHT GAGE METAL FRAMING
- INTERIOR GYPSUM WALL BOARD

NOTES:

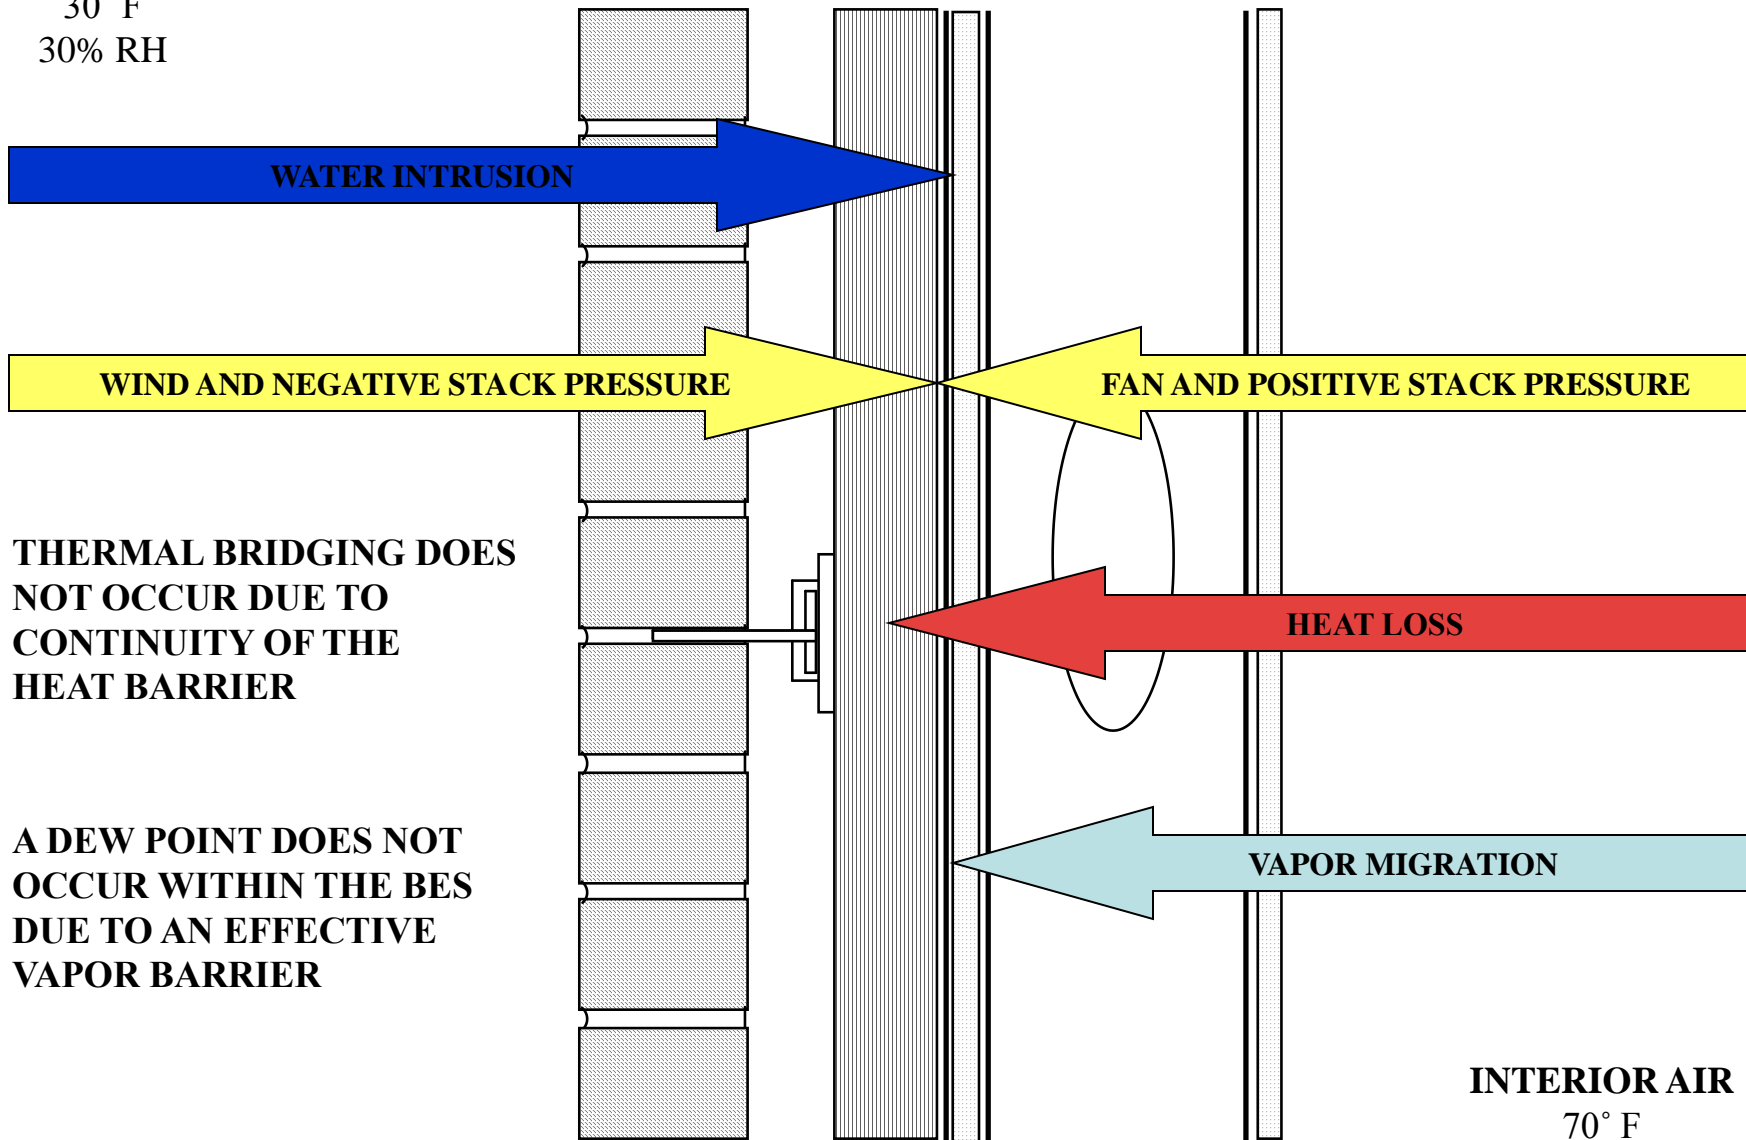

BY INSTALLING THE RIGID INSULATION IN THE CAVITY, THE VAPOR BARRIER CAN BE LOCATED AT THE EXTERIOR FACE OF THE EXTERIOR GWB SHEATHING.

RIGID INSULATION WITH BATTS INSULATION BETWEEN THE LGMF MEMBERS CAN ALSO BE USED FOR THE INSULATION LAYER AS LONG AS 2/3 OF THE R-VALUE OF THE TOTAL INSULATION LAYER IS OUTBOARD OF THE AIR AND VAPOR BARRIER.

Cold Climate Air And Vapor Barrier System: Winter
